

**Question 8**

**(45 marks)**

The height of the water in a port was measured over a period of time. The average height was found to be 1.6 m. The height measured in metres,  $h(t)$ , was modelled using the function

$$h(t) = 1.6 + 1.5 \cos\left(\frac{\pi}{6}t\right)$$

where  $t$  represents the number of hours since the last recorded high tide and  $\left(\frac{\pi}{6}t\right)$  is expressed in radians.

- (a) Find the period and range of  $h(t)$ .

Period:  $= \frac{2\pi}{\frac{\pi}{6}} = \boxed{12 \text{ hours}}$

Range:  $[1.6 - 1.5, 1.6 + 1.5] = [0.1 \text{ m}, 3.1 \text{ m}]$

- (b) Find the maximum height of the water in the port.

Max height =  $\boxed{3.1 \text{ m}}$

- (c) Find the rate at which the height of the water is changing when  $t = 2$ , correct to two decimal places. Explain your answer in the context of the question.

Rate:  $\frac{dh}{dt} = -1.5 \sin\left(\frac{\pi}{6}t\right) \left(\frac{\pi}{6}\right)$

$t = 2 \Rightarrow -1.5 \sin\left(\frac{\pi}{6}(2)\right) \left(\frac{\pi}{6}\right)$

$= \boxed{-0.68 \text{ m/h}}$

Explanation: The tide is going out.

The water is going down by 0.68 m per hour at 2 am.

----------	------	---------

- (d) (i) On a particular day the high tide occurred at midnight (i.e.  $t = 0$ ). Use the function to complete the table and show the height,  $h(t)$ , of the water between midnight and the following midnight.

$h(t) = 1.6 + 1.5 \cos\left(\frac{\pi}{6}t\right)$									
Time	Midnight	3 a.m.	6 a.m.	9 a.m.	12 noon	3 p.m.	6 p.m.	9 p.m.	Midnight
$t$ (hours)	0	3	6	9	12	15	18	21	24
$h(t)$ (m)	3.1	1.6	0.1	1.6	3.1	1.6	0.1	1.6	3.1

- (ii) Sketch the graph of  $h(t)$  between midnight and the following midnight.

SEC Set C  
2016 P2

- (e) Find, from your sketch, the difference in water height between low tide and high tide.

$$\begin{aligned} \text{Difference} &= 3.1 - 0.1 \\ &= \boxed{3 \text{ m}} \end{aligned}$$

- (f) A fully loaded barge enters the port, unloads its cargo and departs some time later. The fully loaded barge requires a minimum water level of 2 m. When the barge is unloaded it only requires 1.5 m. Use your graph to estimate the **maximum** amount of time that the barge can spend in port, without resting on the sea-bed.

From graph: enter port around 9.30  
leave port around 15.15

$$\therefore \text{Time} = \boxed{5 \text{ hr } 45 \text{ min}} \text{ roughly}$$
